# Linear Equations Questions for CDSE, CGL Tier 2, CGL Tier 1 and SSC 10+2

## Linear Equations Quiz 1

Direction: Study the following questions carefully and choose the right answer.

1. Find the value of x and y from the given equation:

$$3x + 2y = 4, 8x + 5y = 9.$$

- A.  $\{(2, 5)\}$  B.  $\{(-2, 5)\}$   
C.  $\{(-2, 3)\}$  D.  $\{(1, 3)\}$

2. Find the value of the given below information

Solve:  $\frac{6}{x} + \frac{3}{y} = 7, \frac{3}{x} + \frac{9}{y} = 11.$

- A.  $x = 3/2, y = 1$  B.  $x = 3, y = 1$   
C.  $x = 2, y = 1$  D.  $x = 1, y = 3$

3. The value of y in the solution of the equation  $2^{x+y} = 2^{x-y} = \sqrt{8}$  is:

- A. 0 B.  $1/4$   
C.  $1/2$  D.  $3/4$

4. The solution of the equation  $x - y = 0.9$  and  $\frac{11}{2(x + y)} = 1$  is

- A.  $x = 3.2, y = 2.3$  B.  $x = 1, y = 0.1$   
C.  $x = 2, y = 1.1$  D. None of these

5. The solution set of the equations  $\frac{1}{2(2x + 3y)} + \frac{12}{7(3x - 27)}$

$$= \frac{1}{2}; \text{ and } \frac{7}{2x + 3y} + \frac{4}{3x - 2y} = 2 \text{ is:}$$

- A.  $\{(1, 0)\}$  B.  $\{(1, -1)\}$   
C.  $\{(1, 2)\}$  D.  $\{(2, 1)\}$

**6. From a two digit number, sum of whose digits is 10, if 18 is subtracted, digits of the num are reversed. Then the number is:**

- A. 64 B. 46  
C. 55 D. 73

**7. A man has some hens and cows. If the number of heads be 48 and number of feet equals 140, the number of hens will be:**

- A. 26 B. 24  
C. 23 D. 22

**8. The sum of two numbers is 80. If the larger number exceeds four times the smaller one by 5. Then the smaller number is**

- A. 5 B. 15  
C. 20 D. 25

**9. If from twice the greater of the two numbers 20 is subtracted, the result is the other number. If from twice the smaller number 5 is subtracted, the result is the first number. The largest number is:**

- A. 12 B. 18  
C. 15 D. 25

**10. The system of equations  $3x + y - 1 = 0$  and  $6x + 2y - 2 = 0$ .**

- A. Has  $x = 1$  and  $y = 2$  as solutions  
B. Has  $x = -1$  and  $y = -2$  as solutions  
C. Does not have a solution  
D. Has infinitely many solutions

**Correct answers:**

1	2	3	4	5	6	7	8	9	10
B	A	A	A	D	A	A	A	C	D

**Explanations:**

- 1). To eliminate  $x$ , we must make the coefficients of  $x$  equal in both of the given equation.

So, multiplying the first equation by 8, second equation by 3 and subtracting, we get:  $y = 5$ .

Putting  $y = 5$  in first equations, we get  $3x + 10 = 4$  or  $3x = -6$  or  $x = -2$ .

$\therefore$  Solution set is  $\{(-2, 5)\}$ .

Hence, option B is correct.

- 2). Putting  $\frac{1}{x} = u$  and  $\frac{1}{y} = v$ , The given equation become:

$$6u + 3v = 7 \text{ and } 3u + 9v = 11.$$

On solving these equations, we get:  $u = \frac{2}{3}$  and  $v = 1$ .

$$\therefore \frac{1}{x} = \frac{2}{3} \text{ and } \frac{1}{y} = 1. \text{ So, } x = \frac{3}{2} \text{ and } y = 1.$$

Hence, option A is correct.

- 3).  $2^{x+y} = 2^{x-y}$

$$2^{x+y} = 2^{x-y} = 8 = 2^{3/2}$$

$$\Leftrightarrow x + y = \frac{3}{2}, x - y = \frac{3}{2}.$$

Solving these equation we get:

$$x = \frac{3}{2} \text{ \& } y = 0.$$

Hence, option A is correct.

- 4). By cross multiplication, 2nd equation becomes  $2x + 2y = 11$ .

Now multiplying 1st equation by 2 and adding to this equation, we get  $4x = 12.8$  or  $x = 3.2$ .

Putting  $x = 3.2$  in 1st equation, we get  $y = 3.2 - 0.9 = 2.3$ .

Hence, option A is correct.

- 5). Putting  $\frac{1}{2x + 3y} = u$  and

$$\frac{1}{3x - 2y} = v,$$

the given equations becomes:

$$\frac{1}{2}u + \frac{12}{7}v = \frac{1}{2} \text{ and } 7u + 4v = 2.$$

$$\text{or } 7u + 24v = 7 \text{ and } 7u + 4v = 2.$$

Solving these, we get:

$$v = \frac{1}{4} \text{ and } u = \frac{1}{7}.$$

$$\therefore 2x + 3y = 7 \text{ and } 3x - 2y = 4.$$

Now solving these equations again, we get:  $x = 2$  and  $y = 1$ .

$$\therefore \text{Solution set} = \{(2,1)\}.$$

Hence, option D is correct.

**6).** Let ten's digit =  $x$  & unit digit =  $y$ . Then,

$$x + y = 10 \text{ \& } 10x + y - 18 = 10y + x$$

$$\therefore x + y = 10 \text{ \& } x - y = 2. \text{ So, } x = 6 \text{ and } y = 4.$$

So, the number is 64.

Hence, option A is correct.

**7).** Let there be  $x$  hens and  $y$  cows. Then,

$$x + y = 48 \text{ and } 2x + 4y = 140$$

Solving  $x + y = 48$  and  $x + 2y = 70$ , we get:  $x = 26$ .

Hence, option A is correct.

**8).** Let the number be  $x$  and  $y$ . then,

$$x + y = 80 \text{ ..... (i)}$$

$$\text{and } x - 4y = 5. \text{ ..... (ii)}$$

Solving these equation, we get:

$$y = 15.$$

Hence, option B is correct.

- 9). Let the larger number be  $x$  and the smaller be  $y$ .

Then,  $2x - 20 = y$  and  $2y - 5 = x$

$$\therefore 2x - y = 20 \text{ \& } x - 2y = -5.$$

by solving these equation, we get:  $x = 15$  \&  $y = 10$ .

Hence, the larger number = 15.

Hence, option C is correct.

- 10). The given equations are  $3x + y = 1$  \&  $2(3x + y) = 2$ .

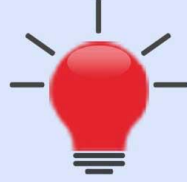

or  $3x + y = 1$  \&  $3x + y = 1$

Thus, there is one equation in two variables.

Hence, option D is correct.
